About

I'm a software engineer who ships ***production systems end to end*** — from a ***real-time auction engine*** serving ***thousands of concurrent users*** to ***payment integrations*** across five providers. Since May 2026 I've worked at FameLink on a ***GenAI media platform***: ***GPU image & video generation***, ***LLM chat*** and ***content safety***. On the side I build ***multi-agent developer tooling***. I work across ***TypeScript/Node.js***, ***PHP/Laravel*** and ***Python*** with ***PostgreSQL***, ***Redis*** and ***Docker*** — and I optimize for ***measurable outcomes***, like cutting response times by ***~40%*** on a high-traffic platform.

In addition to my technical skills, I am passionate about art, dance, sports, music, photography, and motorcycles, all of which fuel my creativity and enhance my problem-solving abilities.

Skills

TypeScript | Node.js | Next.js | React | Python | LLM Integration | Agentic AI | Multi-agent Orchestration | AI Image & Video Generation | Voice AI (TTS) | AI Chatbots | Content Moderation | Trust & Safety | Prompt Engineering | PHP | Laravel | PostgreSQL | MySQL | Redis | RESTful API | Websockets | OAuth | Application Security | Multi-tenant SaaS | Subscription Billing | VueJS | Tailwind CSS | SEO

AI Toolchain

Claude Code | Codex | Cursor | Antigravity | Obsidian

Every feature runs through a structured, AI-augmented multi-agent workflow:

Plan › Review › Multi-agent build › Automated QA › Ship

— A matrix of specialized agents — planning, implementation, code review, security, and verification — coordinated in an automated QA loop.

— Token-optimization tooling (RTK proxy) in the loop cuts AI-operation cost by 60–90%.

— A self-improving loop: agent errors are captured, distilled into reusable rules, and tracked on a live dashboard — the system learns from its own mistakes.

— Persistent memory in an Obsidian second brain: every session is summarized into a daily note and compiled into a linked knowledge base, and the next session starts with the rules, open threads and knowledge index already loaded. Adapted from a public recipe; the redaction layer that strips credentials before anything is summarized or synced is my own.

Infrastructure & Tools

Hosting & Infrastructure

Vercel · Hetzner · DigitalOcean · Laravel Forge · Dokploy · Caddy · Cloudflare · Traefik · Docker · Nginx · RabbitMQ

Observability

Sentry · PostHog · Grafana · Prometheus · Google Search Console

AI & LLM Providers

OpenAI · xAI (Grok) · Hugging Face · RunPod · Vast.ai · ElevenLabs · Vector DB · OpenRouter

Payments

Stripe · iyzico · NOWPayments · PayTR · Centrobill

Dev & Security

GitHub Actions · Postman · Burp Suite · Strapi · GitHub · Jest · Playwright

Comms & PM

Slack · Linear · Jira · Notion

Messaging & Email

Resend · Brevo · Emailable · Netgsm

Work Experience

FameLink Full Time Contract — May 2026 - Present

Software Engineer

FameLink is a ***GenAI*** company building ***conversational AI and generative media*** products on a shared ***multi-tenant*** platform.

- Took one brand's web app (***Next.js 16, React 19***) from a UI prototype on mock data to a live product in ***eight weeks*** as its main engineer, wiring up sign-up, real-time chat, AI character creation, image and video generation, and subscriptions.
- Built ***cost and latency tracking*** for GPU image generation, checked against the provider's own numbers, and ran the ***acceptance tests*** a new image worker had to pass before production.
- Designed the ***job queue with serverless fallback*** for the planned move to dedicated GPUs.
- Built the ***renewal relay*** that routes subscription renewals between the brands' payment accounts.

- Linked every ***credit charge and refund*** to the generation it paid for.
- Built a daily ***bot-farm detection*** job; every rule ran as a dry run first and has a kill switch and alerts.
- Initiated ***security reviews*** of login, admin and public endpoints and shipped the fixes.
- Built the ***Grafana*** and ***PostHog*** dashboards the team uses to track GPU queues, abuse detection, payments, email delivery, revenue and subscriptions.
- Ran the ***technical SEO*** for a platform migration: canonical host, redirects for old URLs and server-rendered landing pages.
- Moved ***transactional email*** to a new provider with automatic fallback, spotted deliverability risks early and brought the ***bounce and complaint rates*** down.

Turkticaret.Net Full Time — Jan 2024 - Dec 2025

Backend Developer

Turkticaret.Net is a leading ***domain and hosting provider*** in Turkey, serving high-traffic digital services — ***domain registration***, ***hosting***, and ***SSL/security certificates***.

- Cut key query and page response times by ***~40%*** by removing N+1 queries and adding ***Redis caching*** on hot paths.
- Built and secured ***payment gateway*** integrations for recurring hosting and domain billing.
- Automated recurring operations with ***cron jobs*** and ***queue workers***, removing hours of manual work each week.
- Integrated an ***LLM-based assistant*** to automatically review and moderate user ***feedback content***.
- Applied ***SOLID principles*** to keep a large PHP codebase maintainable under growing load.

Turkticaret.Net Workplace Training — Oct 2022 - Jan 2023

Intern

I improved myself further with ***HTML, CSS, JavaScript and JQuery***. I also handled the backend with ***PHP, SQL***. Additionally I learned fundamentals of ***Nodejs*** and frameworks like ***Laravel*** and ***Django***. I got familiar with content management systems and ***MVC structure***.

Turkticaret.Net Internship — Jun 2022 - Aug 2022

Intern

I learned the technologies that make websites work, like ***HTML, CSS, JavaScript***. I learned and deployed a website using ***JQuery*** and ***PHP*** with a ***MySQL database***.

Education

University of Lodz — Feb 2023 - Jul 2023

Erasmus - Computer Science

Bursa Uludağ University — 2021 - 2023

Associate Degree — Computer Programming | CGPA 3.53/4.00

MSÜ Kara Harp Okulu — 2019 - 2021

Bachelor's Degree | Russian Preparatory

Certificates

B

IELTS Academic 2025
C1 | 7.5

P

Backend Web Development Path with Beginner Level PHP 2021
Patika.Dev

M

Language (Russian) - MSÜ 2020
Certificate of Excellence in Russian Preparatory Course

Projects

Arabamsende.com

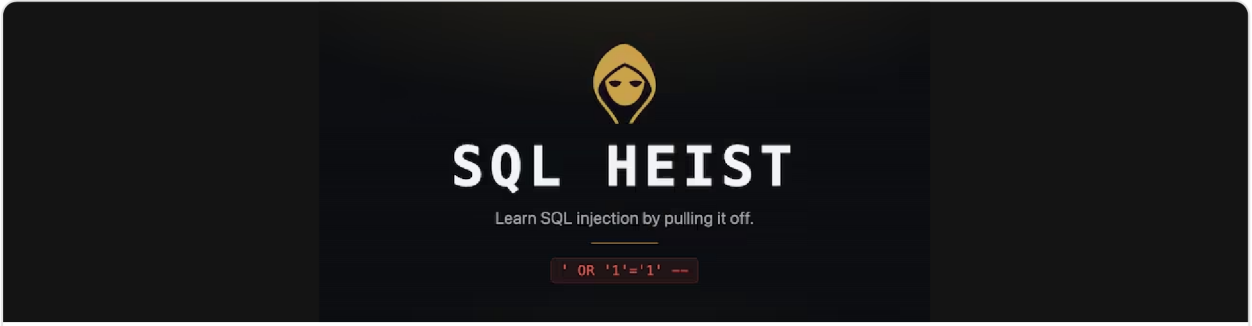

September 2025 - February 2026

ArabamSende.com is a ***vehicle auction and valuation platform***. I worked across the full lifecycle, from architecture to production.

- Architected a ***real-time auction engine*** over ***WebSockets*** (Laravel Echo) for live bidding with ***thousands of concurrent users***.
- Ran the app on ***Laravel Octane + FrankenPHP*** (Caddy) for persistent, high-throughput request handling.
- Integrated the ***payment system*** and tuned ***PostgreSQL*** and ***Redis*** for auction-time load.

Laravel | VueJS | Tailwind CSS | Websocket | PostgreSQL | SEO | Payment System | Laravel Echo | Laravel Octane | Caddy & FrankenPHP | Docker | Redis

Website

SQL Heist

2026

A ***noir browser game that teaches SQL injection*** — and how to defend against it. Built as an ***educational, defensive-security*** experience.

- Runs a ***real SQLite database entirely in the browser*** via ***sql.js*** (WASM) — no backend, every attack executes for real, 100% client-side.
- Each level is a data-driven ***attack → detection → secure-fix*** loop, with golden tests validating both the vulnerable and the patched queries.
- ***Next.js*** with a noir design system — a semantic color language and layered SQL-syntax rendering.

Next.js | TypeScript | sql.js (WASM) | SQL Injection | Defensive Security | Client-side DB

Play | GitHub

vibecosystem (fork)

2026 - Present

My ***daily-driver fork*** of vibecosystem — an open-source ***AI software team*** for Claude Code (138 agents, 296 skills, 74 hooks) — ***extended substantially*** on top of upstream.

- ***Canavar error-learning system***: agent transcripts are scanned for tool errors, unverified claims and retry storms; mistakes feed a shared ledger so one agent's failure trains the whole team.
- ***Shared hook library with tests*** and an extended ***agent-monitoring dashboard*** (WebSocket auto-reconnect, stuck-agent detection).
- ***Worktree handoff protocol*** preventing isolated agents from stranding uncommitted changes.

Claude Code | TypeScript | Agentic AI | Multi-agent Orchestration | Hooks & Automation | Developer Tooling

GitHub

I Want To Ask You Something

Jul 2026

A ***cinematic single-page 'will you go on a date with me?'*** experience — ***zero dependencies, no build***, works offline.

- Hand-built ***custom calendar***, an escaping 'No' button, confetti and a downloadable 'It is a date!' ticket card.
- ***No backend***: reaching the summary fires an instant ***push + email*** notification (ntfy + Web3Forms) straight from the browser.
- ***PWA*** (installable, offline shell) with synthesized ***WebAudio*** sound and an accessible, `prefers-reduced-motion`-aware UI.

Vanilla JS | HTML/CSS | PWA | Web Audio API | Canvas | Zero Dependencies

Live | GitHub

Boostarea.net

Nov 2024 - May 2025

Boostarea.net is a ***service platform for online games***. I worked ***full-stack*** on the site, across frontend and backend.

- Built customer-facing pages with ***jQuery / Bootstrap*** and server-side features on a ***PHP / Zend*** stack.
- Integrated the ***payment gateway*** and added ***real-time*** updates via ***WebSockets***, backed by ***MySQL***.

PHP | JQuery | Bootstrap 5 | Zend Framework | Websocket | MySQL | SEO | Payment System | Devops
